

Proliferation and apoptosis as measures of response

Mitch Dowsett
NCI
March, 2007

Proliferation and apoptosis as measures of response

1. Chemotherapy
2. Endocrine therapy

Δ Proliferation (Ki67)

Δ Apoptosis

1,000 cells
scored
% positive

14 gauge core-cut

← 2cm →

3,000 cells
scored
% positive

Ki67

Apoptosis - TUNEL

Proliferation

Or:

- s-phase
- mitotic index
- thymidylate synthase

• BrDU

(Urruticoechea et al
JCO, 2005, 23, 7212)

or
FNA

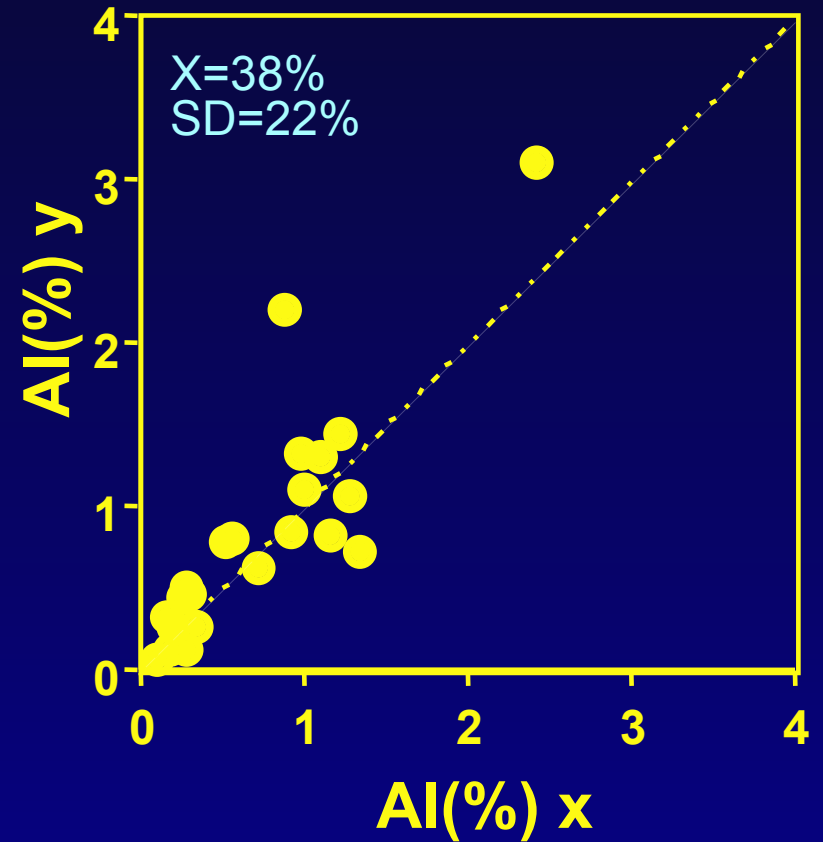

Cell death

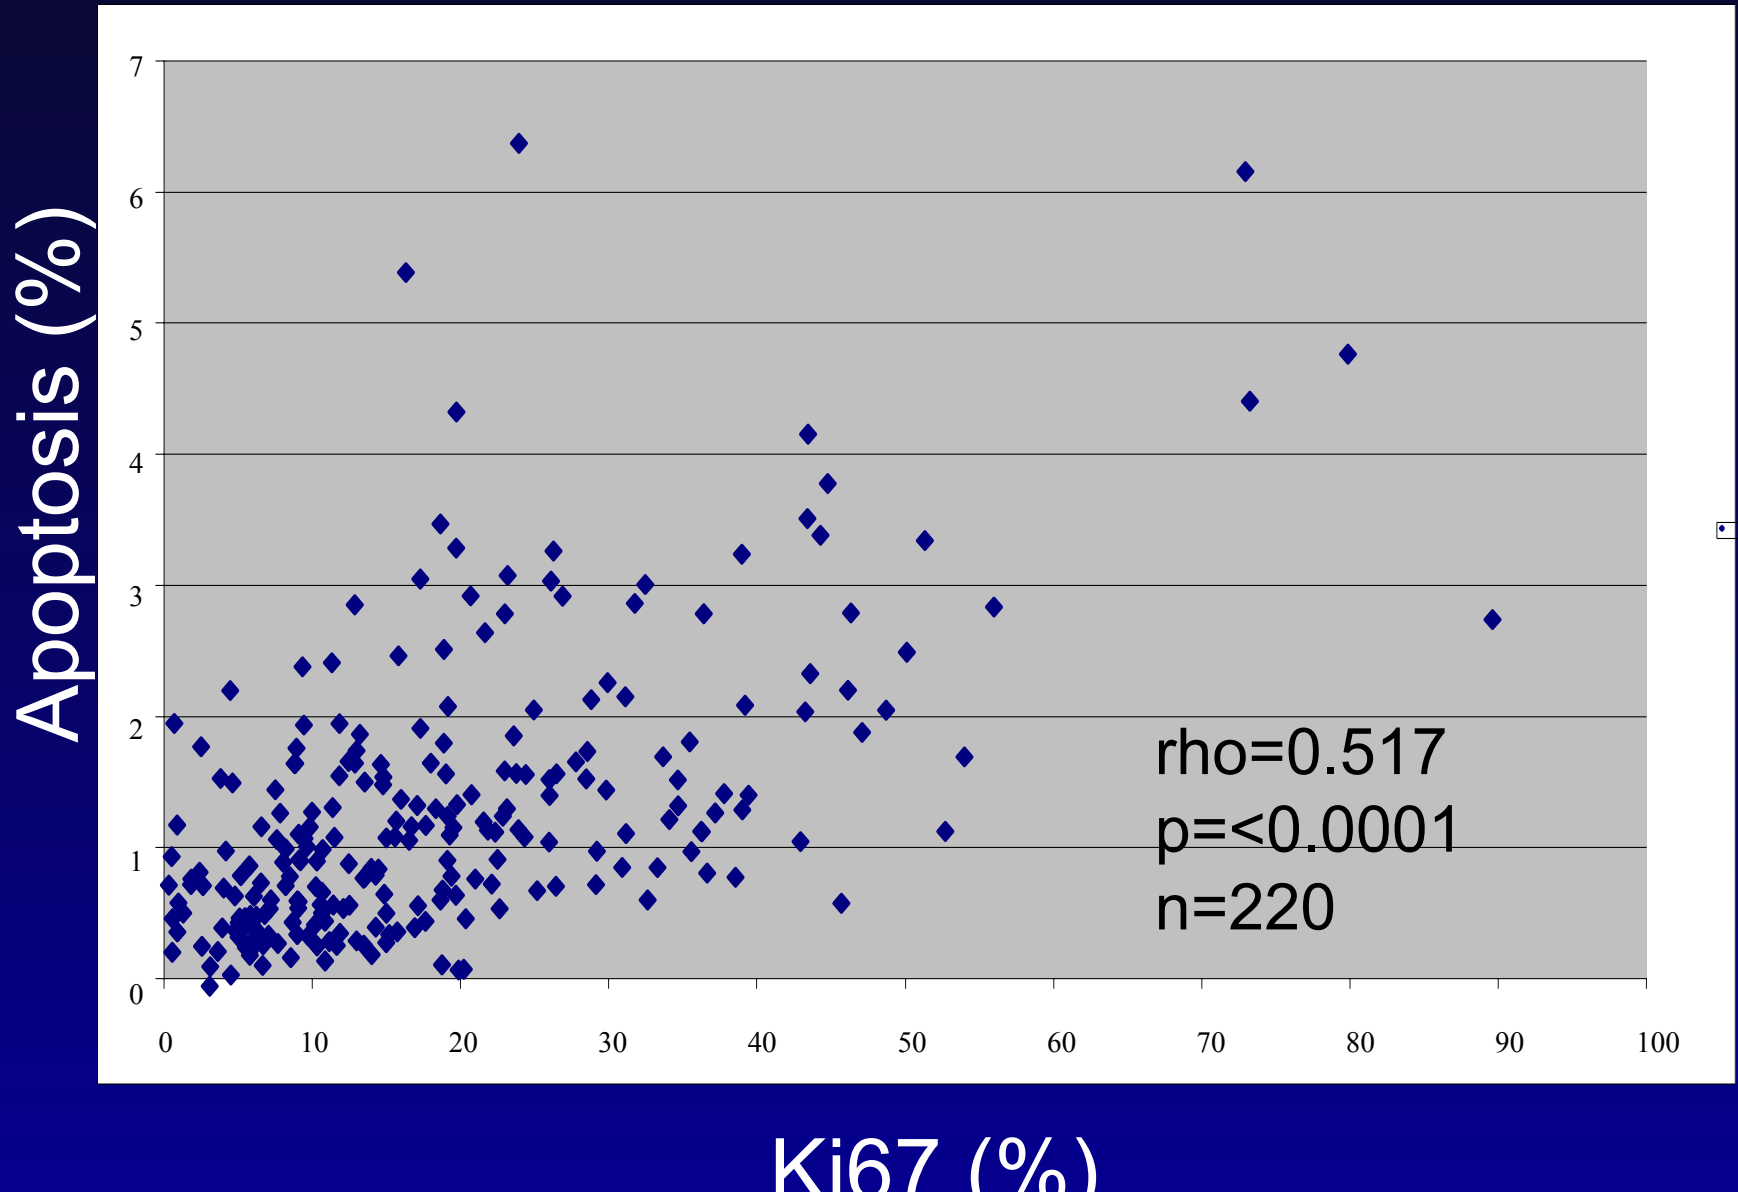

Or:

- morphology
- activated caspase 3
- ? M30 (keratin 8/18)
serum assay
- (also autophagy
and necrosis)

Precision of measurements of Ki67 and AI in pairs of 14g core-cuts

Relationship between Ki67 and apoptosis (IMPACT baseline)

Chemotherapy

High proliferation pretreatment:

good response to chemotherapy

but

poor long term outcome

NB pCR

Effect of 24 hours chemotherapy on apoptotic index and Ki67

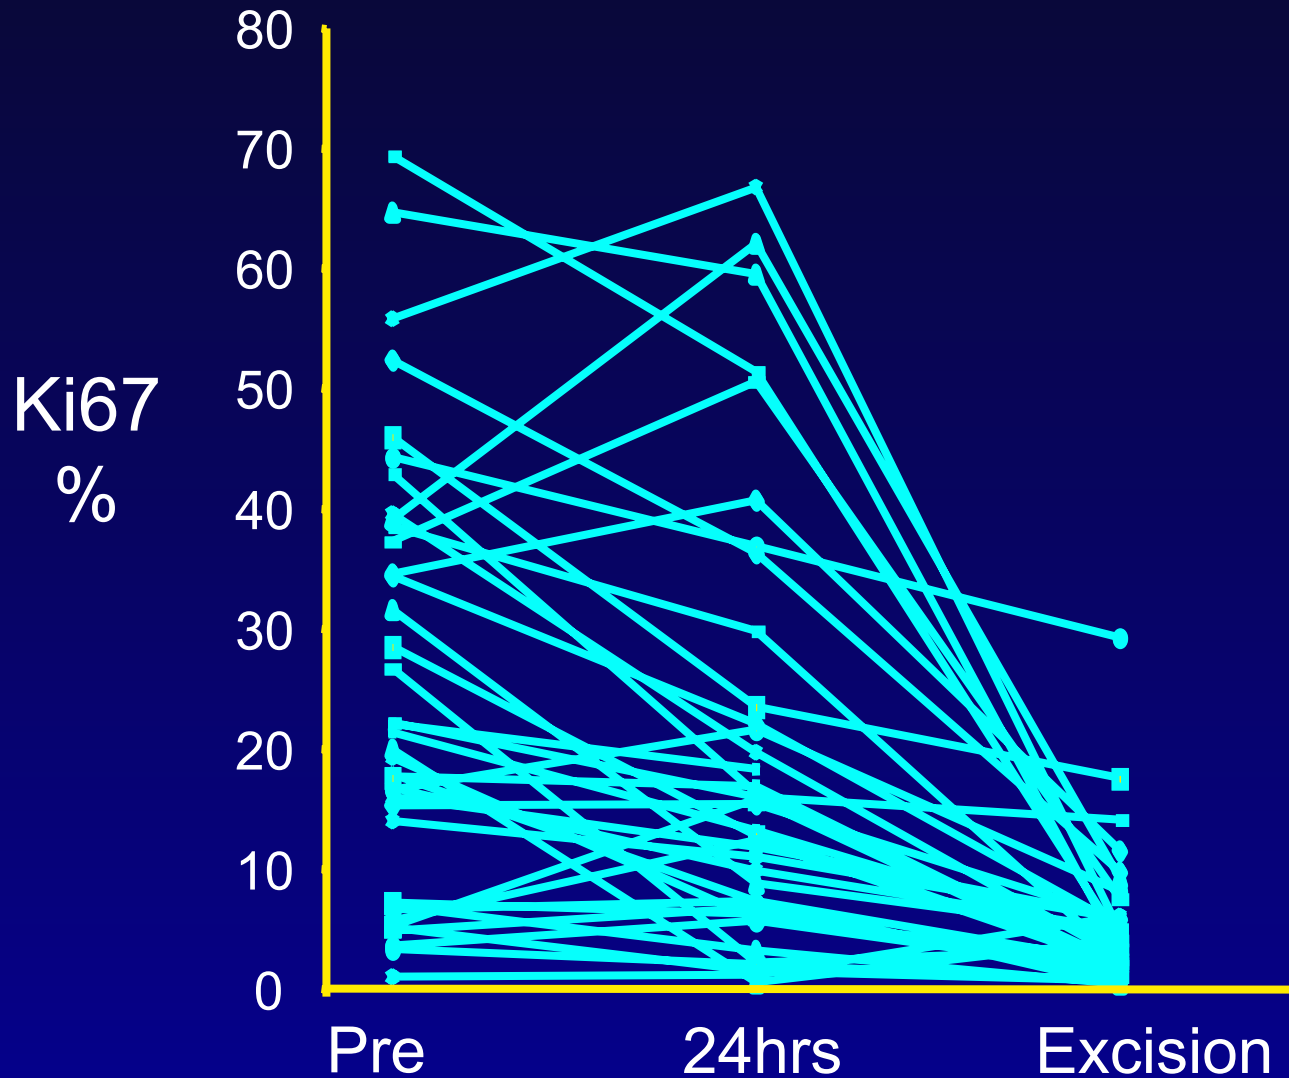

AI (%)

Ki67 (%)

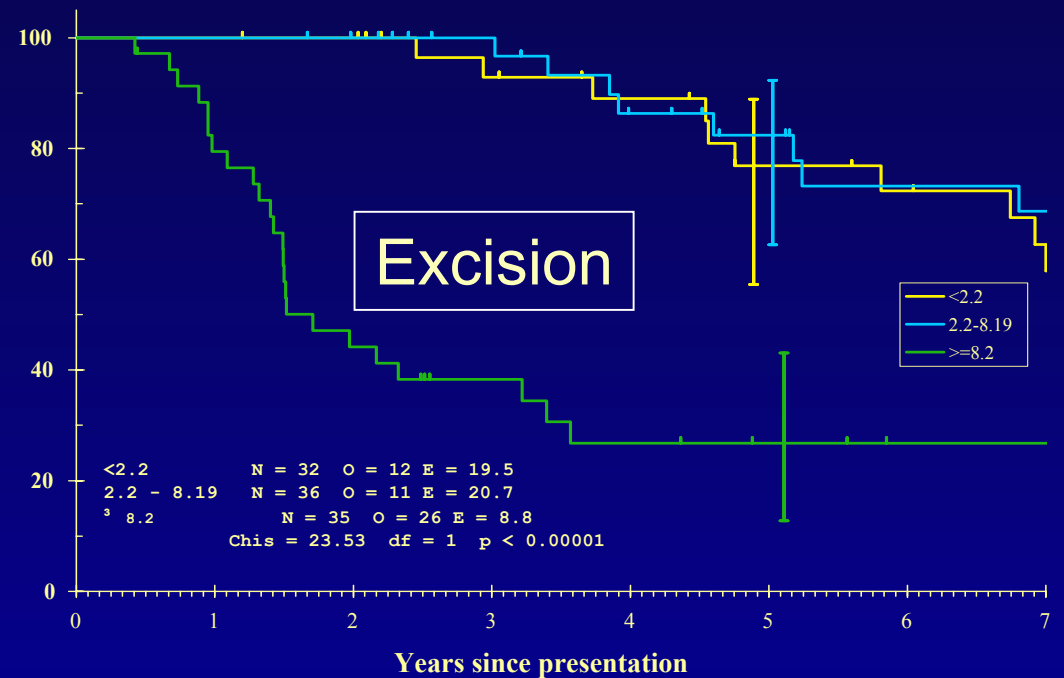

Change in Ki67 with neoadjuvant chemotherapy

Relationship of clinical response with change in Ki67 or apoptosis

	Δ pre/24hr	Δ pre/21d
Ki67↓	Non-significant	Significant: Makris et al 1998 Chang et al 1999 Assersohn 2003
apoptosis↑	Significant: Chang et al 1999 Non-significant: Parton et al 2001	

Pretreatment and excision (matched) Ki67 and RFS with neoadjuvant chemotherapy

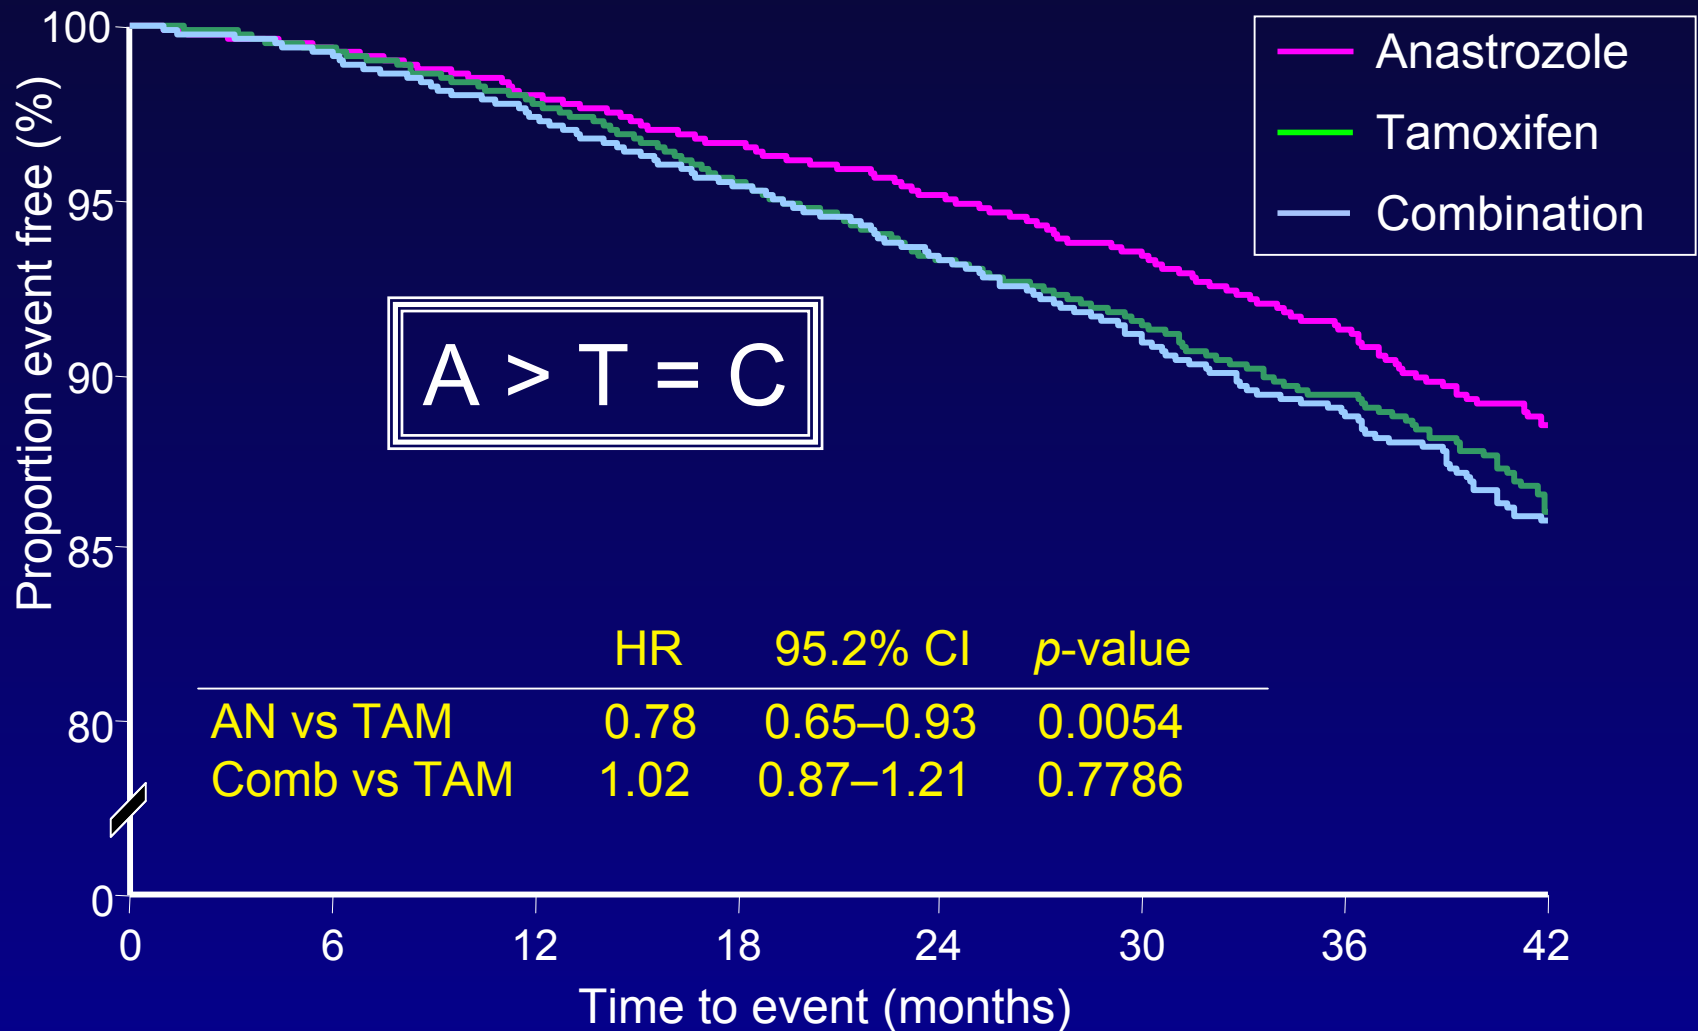

Endocrine therapy

IMPACT: Per Protocol Ki67 Analyses

Anastrozole vs tamoxifen vs combination in ER+ patients

ATAC: Kaplan–Meier Curves of Disease-free Survival in Receptor-positive Population

Curves truncated at 42 months

Apoptosis

Decreased with all 3 arms at 2 weeks
(15-25%)

and

at 12 weeks for anastrozole (21%)

Proliferation Ki67 (%): Individual Patient Plots — Anastrozole (Per-Protocol Population)

Percentage Ki67 Change (95% CI) from Baseline* During Treatment

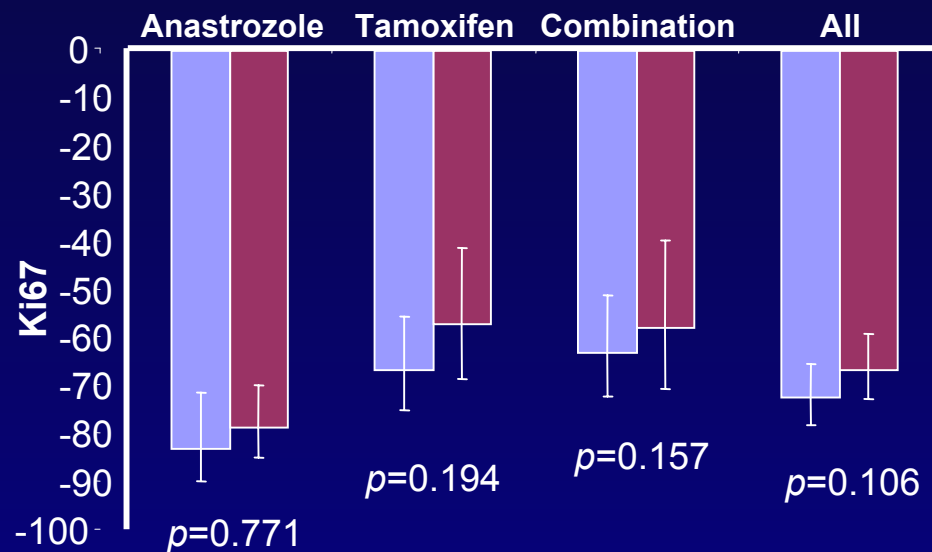

Relationship Between Ki67 Change and Objective Clinical Response

2 Weeks

12 Weeks

Ki67↓ PD

Effect of anastrozole on Ki67 in individual patients

Effect of anastrozole on Ki67 in individual patients

Effect of anastrozole on Ki67 in individual patients

Relapse Free Survival by baseline LnKi67

Relapse Free Survival by 2 week LnKi67

Multivariate analysis: RFS

		HR (95%CI)	p-value
Tumour size	per cm	1.67 (1.35 - 2.06)	<0.001
Ki67 (2 wks)	2.7x increase	2.01 (1.28 - 3.15)	0.002
ER (2wks)	2.7x increase	0.79 (0.62 - 0.99)	0.04

Multivariate analysis: RFS

		HR (95%CI)	p-value
Tumour size	per cm	1.67 (1.35 - 2.06)	<0.001
Ki67 (2 wks)	2.7x increase	2.01 (1.28 - 3.15)	0.002
ER (2wks)	2.7x increase	0.79 (0.62 - 0.99)	0.04

→ POETIC

Short-term presurgical treatment: Biological characteristics of AI response

Presentation

Surgery

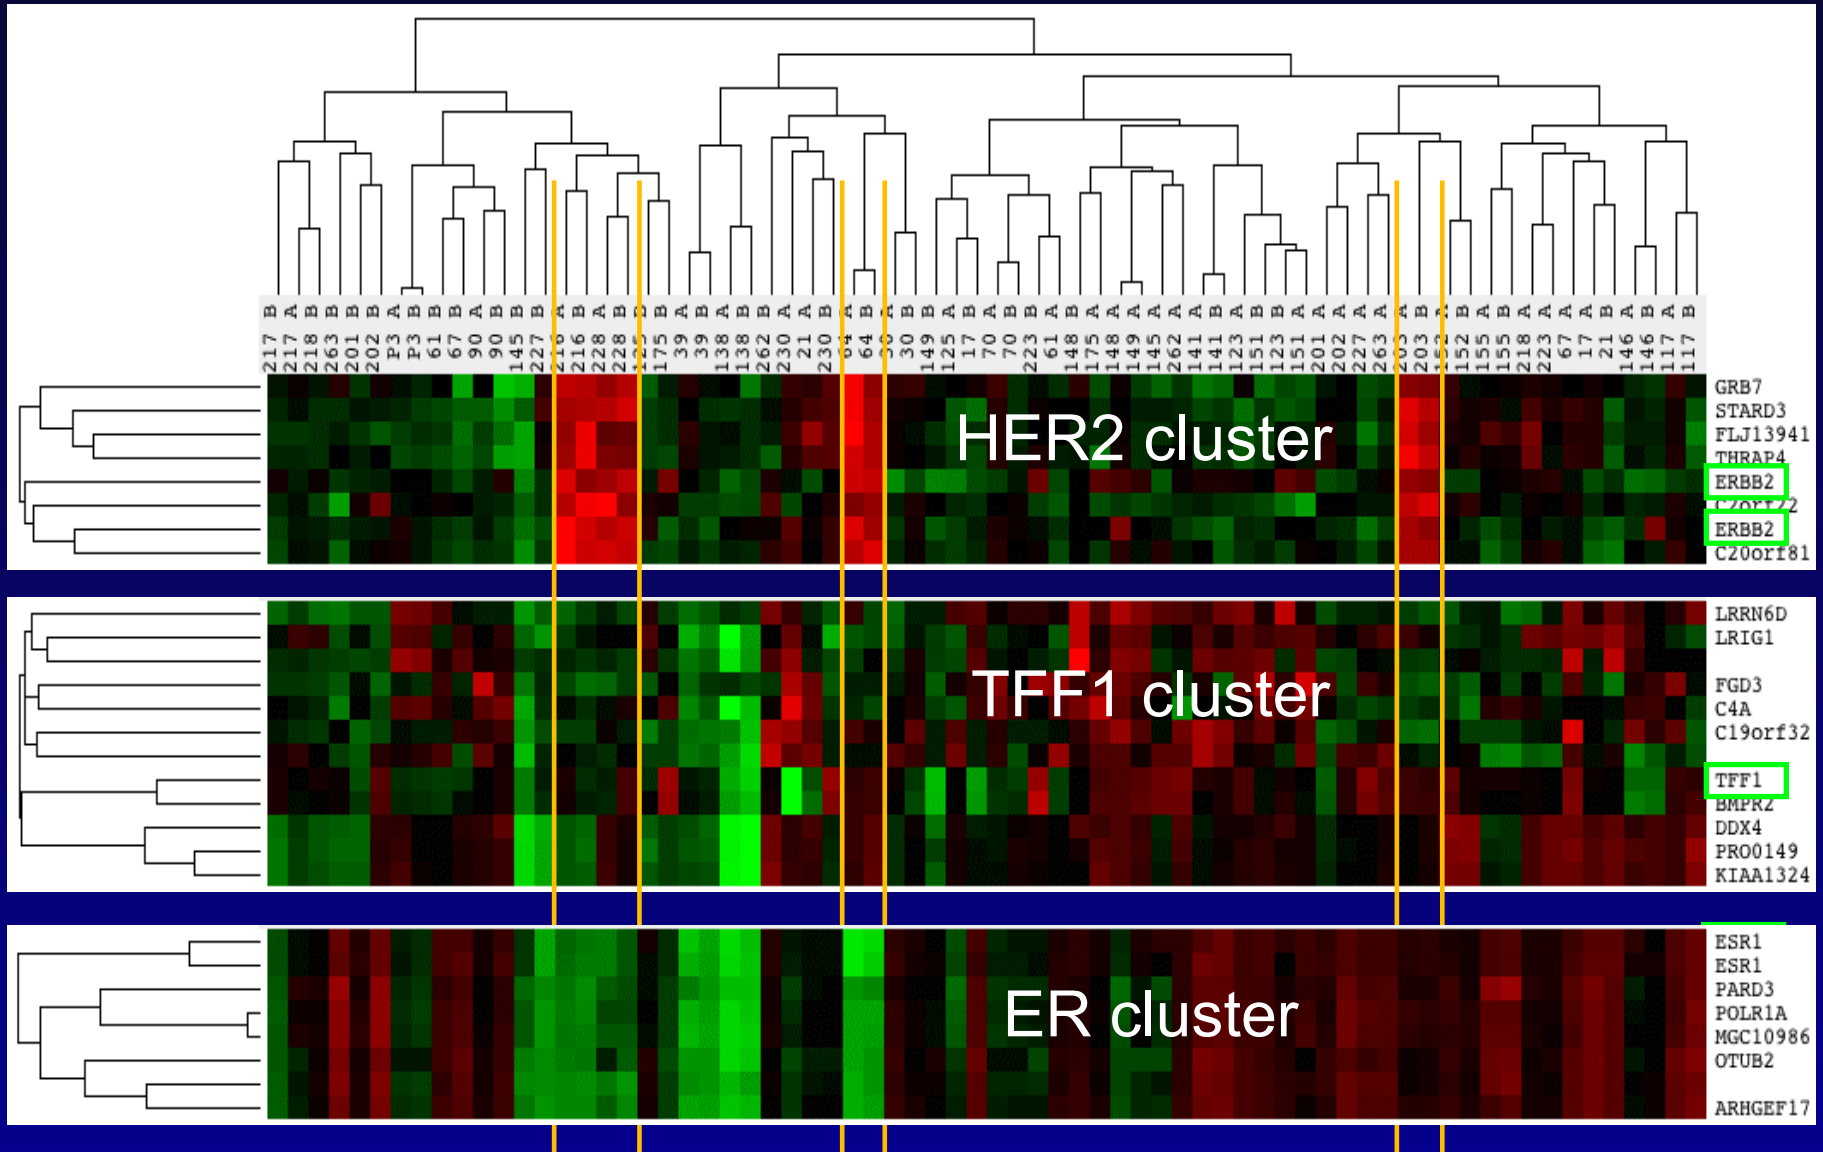

Incidental
medication

biopsy

excision

- 35 ER+ patients
- anastrozole or letrozole
- RNA T7 amplified
- cDNA microarray (17,468 features)

Selected clusters from hierarchical clustering based on 2680 most variable genes

Global index of dependence on estrogen (GIDE)

- Number of genes which change [up or down] beyond a given threshold (x2)
- How does this index vary according to:
 - [ER]
 - HER2

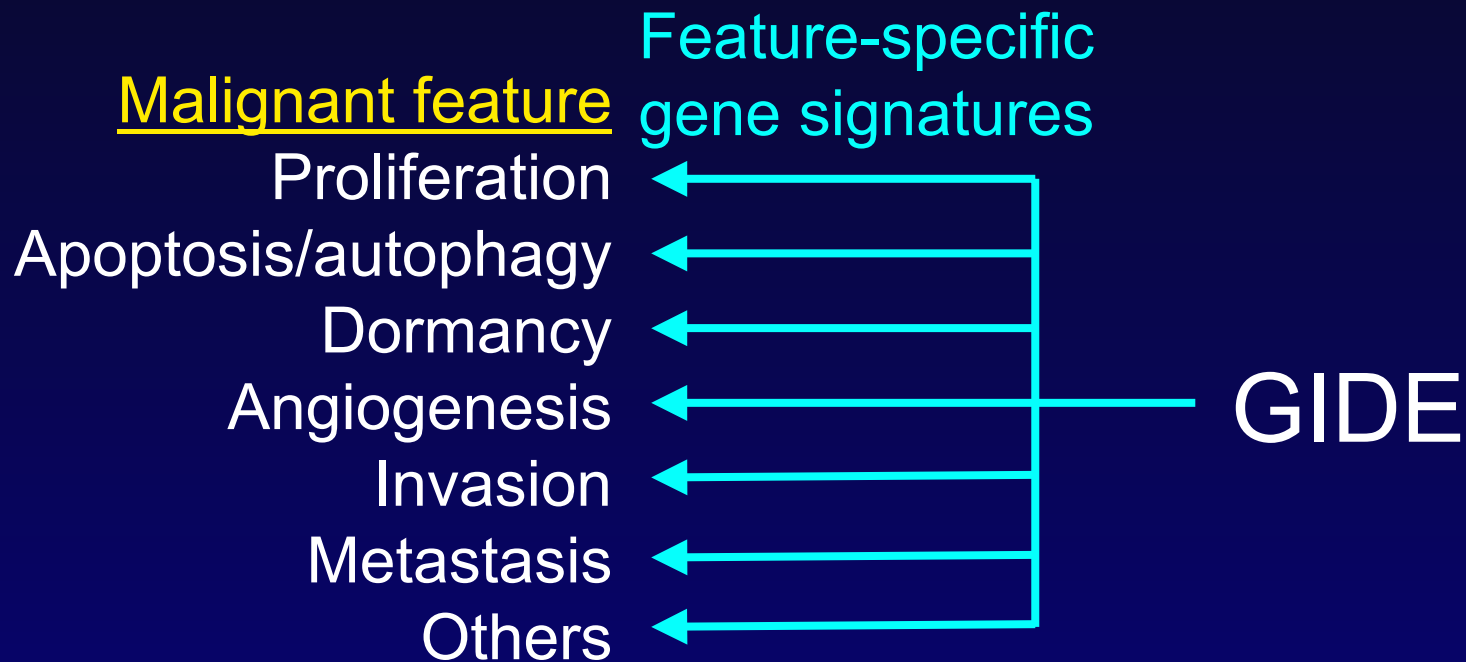

Comparison of GIDE with other markers

Patient **GIDE** ER HER2

Biological disaggregation

Biological disaggregation

- Oestrogen dependency of feature
- Importance in clinical benefit from E-deprivation
- Determinants of response of feature to E-deprivation

Biological disaggregation

- Oestrogen dependency of feature
- Importance in clinical benefit from E-deprivation
- Determinants of response of feature to E-deprivation

→ POETIC

Summary

Chemotherapy

- decreased proliferation is associated with response to treatment
- high residual Ki67 is associated with poor RFS
- increased apoptosis occurs in response to therapy but no close relationship with response

Summary

Endocrine therapy

- decreased proliferation may predict for treatment benefit but no close relationship with clinical response
- high 2 week Ki67 is associated with poor RFS
- increased apoptosis does not occur at 2 weeks or 12 weeks with tamoxifen or AI

Novel agents

Open-minded about effects on apoptosis
and proliferation during early studies

Pre-chemotherapy Ki67 and Relapse Free Survival (matched)

Post-chemotherapy Ki67 and Relapse Free Survival (matched)
